

I believe that the potential for interference with current users of the RF spectrum is too great to justify the implementation of BPL. Japan has in fact banned the use of this technology due to the interference it has caused. Not only would amateur radio operators be subject to massive amounts of interference, but also any other users as well - to include public safety and Homeland Security agencies. I would suggest that the FCC along with the NTIA study the potential for interference to ensure that this technology does not degrade critical communications systems that are needed for public safety and Homeland security.
